Modicon Transformer

Single phase transformers 230 to 400 Vac, 25 to 2500 VA

Modicon ABT7, ABL6

Presentation

Modicon ABT7/ABL6 single-phase transformers are designed to supply control circuits in electrical equipment from a 230 Vac or 400 Vac supply (depending on the model) at 50 or 60 Hz. ± 15 V connectors at the primary ensure adaptation to the actual values of the supply networks to which they are connected.

Transformers 230 V, Single winding: ABT7ESM

The single-winding transformers are primarily designed for repetitive applications and offers the following as standard:
- 230 Vac ± 15 V input voltage
- 24 Vac output voltage
- Panel mounting using 4 screws
- Operating temperature of 40°C *(104°F)*

Transformers 230/400 V, Single winding: ABL6

The single-winding transformers are designed for standard applications:
- 230 V/400 Vac ± 15 V input voltage
- 12 V, 24 V, 115 V or 230 Vac output voltage
- Panel mounting, using 4 screws (or clip-on ⊔ rail-mounting option available depending on the model)
- Operating temperature of 50°C *(122°F)*
- cURus certifications

Transformers 230/400 V, Double winding: ABT7PDU

Transformers with double winding feature an innovative design and offer high-level characteristics (depending on the model) such as:
- 230 V/400 Vac ± 15 V input voltage
- 2 x 115 V or 2 x 24 Vac output voltage
- Clip-on ⊔ rail mounting (depending on the model) or panel mounting (using 4 screws)
- Series or parallel connection of secondary winding and grounding via internal jumpers
- LED indicator
- Operating temperature of 60°C *(140°F)*
- cURus certification

Those components are concealed behind a plastic cover making it easier to integrate the Modicon transformers in control cabinets.

Protection

The transformers can be protected against short-circuits by means of fuses or thermal-magnetic circuit-breakers mounted on the secondary.
For operation in compliance with UL standards, short-circuit protection must be achieved using fuses (UL approved) mounted on the primary.
Where the control circuit is isolated from the ground (IT system), a leakage detector will indicate any accidental ground faults.

Description

1 Mounted using 4 screws or, depending on the model for ABT7PDU types, by clipping on a 35 mm *(1.37 in)* ⊔ rail
2 Screw terminals with ± 15 V connectors for connection of the AC input voltage
3 Clip-on marker tag or self-adhesive marker tag holder AR1SB3
4 LED (green) indicating presence of input voltage (depending on ABT7PDU types)
5 Access to the jumpers for selecting the secondary connection (opened using a screwdriver)
6 Windows (depending on ABT7PDU types) for viewing the connection via jumpers of the:
- 0 V to ground (J1 jumper)
- Series connection, totally freeing up the “customer” secondary wiring capacity (J3 jumper)
- Parallel connection, totally freeing up the “customer” secondary wiring capacity (J2 and J4 jumpers)

7 Screw terminals for connection of the AC output voltage

Note: Phaseo Transformers shown in this document are identified as Modicon as they will undergo a future brand change. All other product documentation will reference Phaseo until the brand change occurs.

Modicon Transformer
Single phase transformers 230 to 400 Vac, 25 to 2500 VA
Modicon ABT7, ABL6

Selection

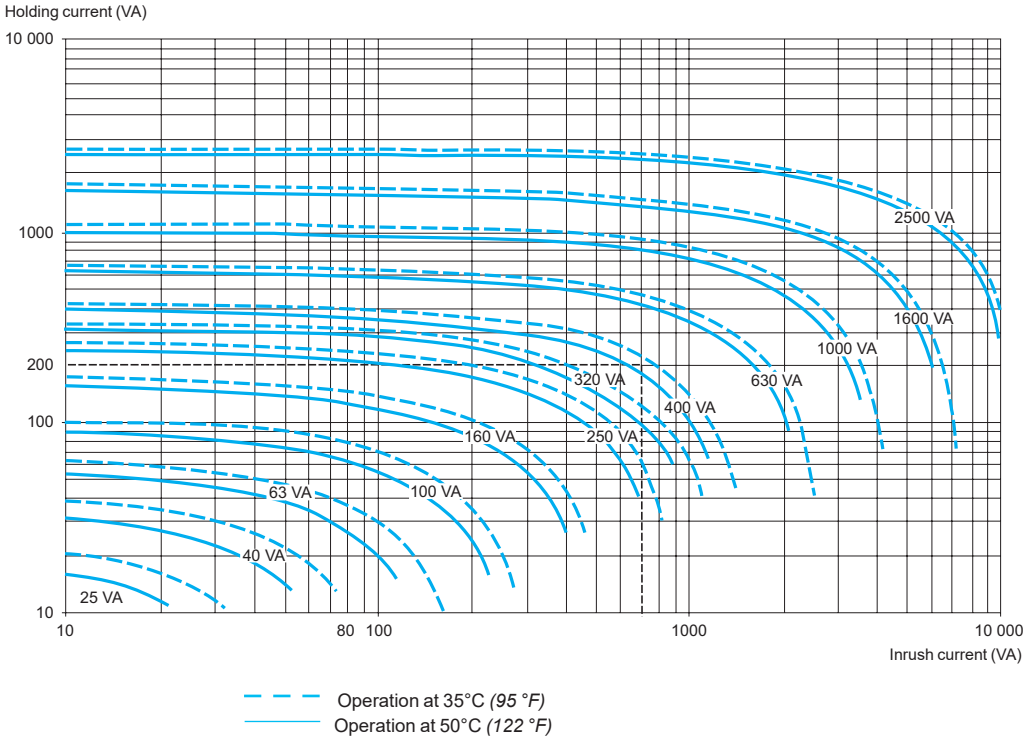
Modicon ABT7/ABL6 transformers are characterized by the apparent nominal power they can supply continuously. However, they are also designed to supply, when necessary, significantly higher powers, such as contactor inrush peaks.

Contactor inrush peaks can reach 10 to 20 times the required holding current. This leads to the transformer being oversized in relation to the continuous power it has to supply. The transformer must be sized so that the voltage drop at its terminals, caused by the inrush, remains with the permissible limits for the contactor to close properly.

The two power values that need to be taken into account to determine which transformer rating to use are therefore:
- The continuous power the transformer has to supply
- The maximum inrush power it has to provide

In practice, only the sum of the holding currents and the contactor inrush current need to be considered.

For **ABL6** transformers, the graph below can be used to select the appropriate rating according to these two currents. This gives a maximum voltage drop of 5% at the moment of inrush, compatible with correct operation of the entire installation. However, these transformers have been designed for continuous operation at nominal load and at an ambient temperature of 50°C *(122 °F)*. A reduction in the ambient temperature may uprate the transformer, which, in some cases, allows a lower rating to be used.
The graph below has been drawn up for ambient temperatures of 35…50°C *(95…122 °F)*



Example: A device with a total holding current of 200 VA and inrush current of the contactor of 700 VA can be supplied by a 630 VA transformer if it is used at an ambient temperature of 50°C *(122 °F)*. A 400 VA transformer is sufficient if the ambient temperature is 35°C *(95 °F)*.
